Let $X = X(t)$ be an Itô process, i.e., a solution of the stochastic differential equation

$$dX = u(X, t) dt + v(X, t) dW,$$

interpreted in the sense of the Itô stochastic integral. Let $f(X, t)$ be twice continuously differentiable. Then the stochastic chain rule, also known as the Itô formula, reads

$$df(X, t) = \left(\frac{\partial f(X, t)}{\partial t} + u(X, t) \frac{\partial f(X, t)}{\partial X} + \frac{1}{2} v(X, t)^2 \frac{\partial^2 f(X, t)}{\partial X^2} \right) dt + v(X, t) \frac{\partial f(X, t)}{\partial X} dW.$$

Verify the Itô formula numerically for the example when $X(t)$ is geometric Brownian motion and

$$f(X, t) = t \sqrt{X}.$$
